## Addon system

- FuelOpt comes as an **addon system**, sending orders to the propulsion control system, the same way the lever (and the hand of the captain) would. It does not **bypass of any existing equipment on board or of the safety associated**.
- The FuelOpt system provides bridge crew with **full control on power, fuel consumption, speed or a combination thereof**.
- It **reduces fuel consumption by controlling the propulsion** and ensuring that propulsive power is optimized in changing environmental conditions based on direct commands from the bridge.

# Changing the philosophy of operating a vessel

## *Case study on one single voyage*

Operating on constant power instead of constant RPM would decrease the overall fuel consumption of a vessel.

---

<b>Vessel Type</b>	Tanker
<b>Size</b>	50 000 dwt
<b>Propulsion</b>	~7 200 kW propulsion power Single Fixed Pitch Propeller
<b>Voyage</b>	Hongkong – Dalian, 4d
<b>Method</b>	Simulation with digital twin modelling

---

## Charts

- During this voyage, the vessel experienced varying weather conditions with an average headwind of 12 m/s.
- The propeller RPM was held more or less constant throughout the voyage.
- The average SOG was 12,37 kn and the average shaft power was 4 829 kW.

# Running on constant power enables more efficient vessel operations

## Results:

Average shaft power with FuelOpt disengaged	4 829 kW
Constant shaft power with FuelOpt engaged	4 520 kW
Difference	309 kW

## Conclusion:

For this specific voyage the vessel would consume 6,4% less fuel if operating on constant power by using FuelOpt instead of running on constant RPM.

Departure	2021-01-02 05:21Z
Est. Arrival	2021-01-06 15:13Z
Total Distance	1306.78 nmi
Total Work	478573.55 kWh
Average Weather Factor	-1.939 knots
Avg. Speed over Ground	12.40 knots
Planning Power	4519.92 kW

# Brief overview of FuelOpt installation

Gather signals from different sensors on the vessel in order to translate vessel signals in order to communicate with propulsion control system and send RPM and pitch demand signals to the installed propulsion control system.

# FuelOpt and Shaft Power Limitation (ShaPoLi) to meet EEXI requirements

- Through ShaPoLi with FuelOpt, a vessel power output is ensured regardless of the changing energy content level of the fuel used.
- The system enables this by simply setting an upper limit to shaft power output:
  - without any modification to existing machinery,
  - without compromising safety in emergency situations that require full engine power.
- Additionally, the FuelOpt system can be easily adapted to fuel related vessel upgrades.

## Route Pilot AI

- Route Pilot AI is an AI-powered ship operation support system to achieve the most energy-efficient voyage.
- Once the AI system is trained with a vessel's operational data, the system creates a digital twin of this specific vessel that is used for calculating the optimal operational parameters for an upcoming voyage considering the predicted voyage conditions.
- The users can access to Route Pilot AI through Fleet Analytics and link it to FuelOpt for executing voyages with maximum efficiency
