VOICE MAIL RECORDING MODULE

MIP Recorder

The Multikom IP system can be supplemented with a module for recording of voice correspondence. Registration besides recording the course of voice correspondence also includes associated data such as:

- timestamps of the beginning and end of the conversation;
- caller IDs in telephone and radio networks

Other network activity data, to which the Multikom system has access, e.g. activity statistics of digital radio networks, can also be recorded.

For cooperation with external applications an API protocol is available, which enables access to all recorded records from external applications e.g. for command support or creating various statistical summaries. Independently from correspondence registration module Multikom 2 system can transfer voice and data to external correspondence registration systems including the most popular on Polish market i.e. companies: TRX, SIM and Compol.
