Auto Routing

Simply plan your voyage from any position to any position, globally

Built on NAVTOR's smart and integrated technology, the new Auto Routing module will generate a smart route suggestion between two positions.

Get on board for intelligent Auto Routing.

The next generation of Auto Routeing

The new integrated Auto Routeing module in NavStation prepares a route suggestion in seconds. This quickly provides an overview for distance and duration and it can be used as a foundation for further detailed route planning. The principle of Auto Routeing is based on the shortest route. Using open waters and routeing along predefined lines in restricted areas, such as coastal waters, Traffic Separation Schemes (TSS), entrances into ports etc. You can easily edit and compare the route alternatives.

The Auto Routeing module is fully integrated with the onboard NavStation Route Planning module.

AUTO ROUTEING FEATURES:

Blockers

- Common straits, TSS, canals etc. can be closed
- Controls the routeing alternatives

Routeing

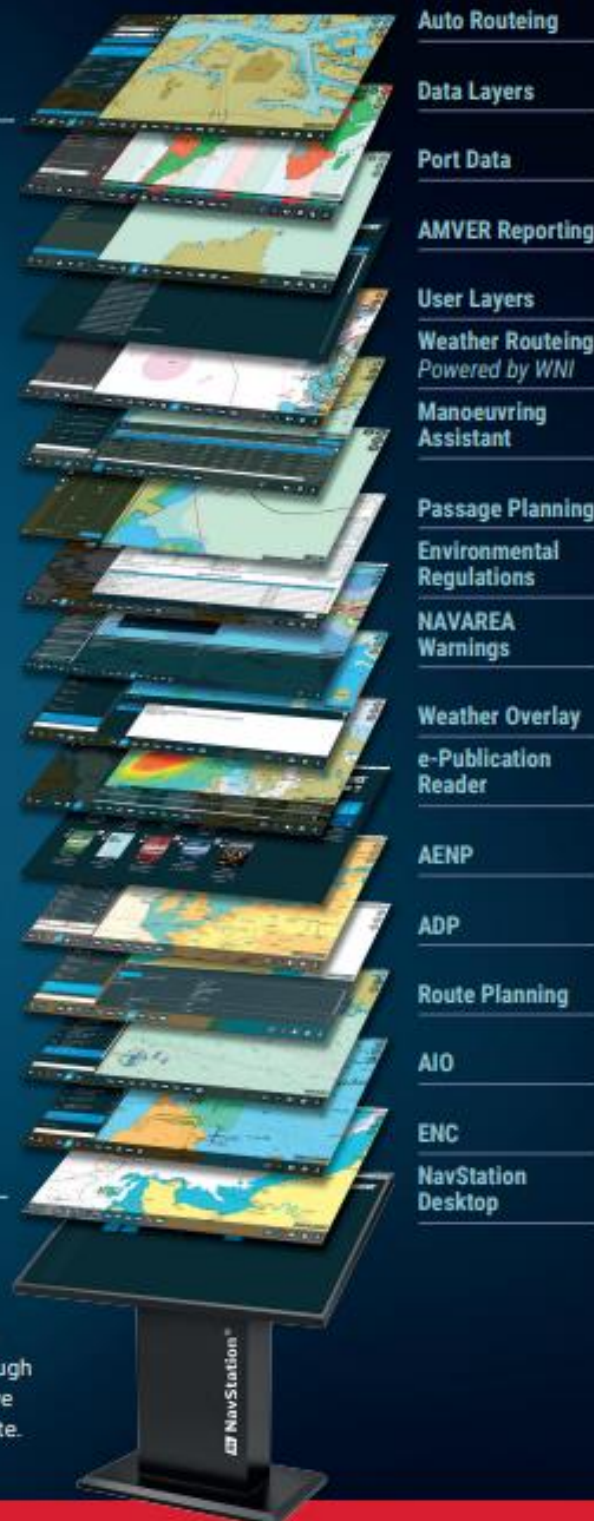

- Shortest route in open waters
- Along predefined route lines in coastal waters, TSS and entrances into ports

Routeing lines into most terminals in major ports

- Select a required location in the port and you will get a complete route suggestion, berth to berth

SAVE TIME AND OPTIMISE COSTS

NavStation includes access to an array of digital navigational information overlayed on top of official ENC charts. With databases and permits automatically distributed and updated seamlessly through our cyber-secure NavBox. NAVTOR continually ensures vessels have the data required to keep them safe, compliant and always up to date.
